Management of Atherosclerotic Carotid and Vertebral Artery Disease: 2017 Clinical Practice Guidelines of the European Society for Vascular Surgery (ESVS)

Writing Group¹, A.R. Naylor, J.-B. Ricco, G.J. de Borst, S. Debus, J. de Hars, A. Halliday, G. Hamilton, J. Kakisis, S. Kakkos, S. Lepidi, H.S. Markus, D.J. McCormick, J. Roy, H. Sillesen, J.C. van der Velde, F. Verma, M. Venermo, M. Vrba, R. Zaidi, R.J. Hinrichs, M. Koedam, M. Vega de Ceniga, F. Verini, ESVS Guideline Reviewers², J. Archie, S. Bellantu, A. Chaudhuri, M. Koelma, A.-K. Lindahl, F. Padberg, M. Venermo

Keywords: Carotid, Vertebral, Stroke, Transient ischaemic attack, Endarterectomy, Stenting, Medical therapy, Screening, Dementia, Asymptomatic, Symptomatic, Thrombolysis, Imaging, Bypass, Surgical techniques, Complications, Patch infection, Restenosis

TABLE OF CONTENTS

What have the 2017 guidelines added to the 2009 Guidelines?	5
1. Methodology and Grading of Recommendations	6
1.1. What is new in methodology?	6
1.2. The Writing Group	6
1.3. The Guideline Committee	6
1.4. Recommendations	6
1.5. What have the 2017 guidelines added to the 2009 guidelines?	6
1.6. Our review process and update of guidelines	6
1.7. Definitions of stroke and transient ischaemic attack	7
2. Management of Carotid Artery Disease	7
2.1. Burden of stroke	7
2.1.1. Definition of stroke and transient ischaemic attack	7
2.1.2. Epidemiology of carotid territory ischaemic stroke	7
2.1.3. Methods for measuring carotid artery stenosis severity	7
2.1.4. Clinical presentation of asymptomatic carotid disease	8
2.1.5. Role of the multidisciplinary team	8
2.2. Secondary prevention in asymptomatic patients	9
2.2.1. Optimal medical therapy	9
2.2.1.1. Risk factor control	9
2.2.1.2. Hypertension	9
2.2.1.3. Lipid-lowering therapy	10
2.2.1.4. Diabetes mellitus	10
2.2.1.5. Treatment in diabetic patients	11
2.2.1.6. Adherence to optimal medical therapy	11
2.2.2. Is stroke important to prevent?	11
2.2.2.1. How important is asymptomatic carotid stenosis?	11
2.2.2.2. Is Duplex ultrasound reliable for diagnosing stenoses severely?	11
2.2.2.3. Prevalence of asymptomatic carotid disease	12
2.2.2.4. What is the best way to screen for it?	12
2.2.2.5. Potential benefits of selective screening	12
2.2.2.6. How to manage asymptomatic carotid disease	12
2.2.2.7. How associated with carotid interventions	12
2.2.2.8. Does screening prevent fatal or non-fatal ischaemic stroke?	12
2.2.2.9. Interventions in asymptomatic patients	12
2.2.3. Medical therapy versus surgery versus best medical therapy	13
2.2.3.1. Medical therapy in the randomised trials	13
2.2.3.1.1. Medical therapy in the randomised trials	13
2.2.3.1.2. Import of subgroup analysis	13

РЕКОМЕНДАЦИИ ЕОК/ЕОСХ ПО ДИАГНОСТИКЕ И ЛЕЧЕНИЮ ЗАБОЛЕВАНИЙ ПЕРИФЕРИЧЕСКИХ АРТЕРИЙ 2017

В документе рассматриваются вопросы атеросклеротической болезни экстракраниальных отделов сонных, позвоночных, мезентериальных, почечных артерий и артерий верхних и нижних конечностей.

Одобрено: Европейской организацией по изучению инсульта (ESO, EOI).

Состав рабочей группы по составлению данных рекомендаций включает в себя представителей Европейского общества кардиологов (ESC, EOK) и Европейского общества сосудистых хирургов (ESVS, EOSX).

Авторы/члены рабочей группы: Victor Aboyan^{*} (Председатель ЕОК) (Франция), Jean-Baptiste Ricco[†] (Со-Председатель) (Франция), Marie-Louise E.L. Bartelink[‡] (Нидерланды), Martin Björk[§] (Швеция), Marianne Brodmann (Австрия), Tina Cohnert[¶] (Австрия), Jean-Philippe Collet (Франция), Martin Coenpuy (Германия), Marco De Carlo (Италия), Sebastian Debuis^{||} (Германия), Christine Espinola-Klein (Германия), Thomas Kahan (Швейцария), Serge Konnatz (Франция), Lucia Mazzolai (Швейцария), A. Ross Naylor^{**} (Великобритания), Marco Roffi (Швейцария), Joachim Rother^{††} (Германия), Muriel Sprynger (Бельгия), Michał Tendler (Польша), Gunnar Tepke (Германия), Maart Venermo^{†††} (Финляндия), Charalambos Vassilopoulos (Греция), Ismaïla Desormeaux (Франция).

Рецензенты: Petr Widimsky (рекензент-координатор ЕОК) (Чехия), Philippe Kolb (рекензент-координатор ЕОСХ) (Бельгия), Stefan Agewall (Норвегия), Héctor Bueno (Испания), Antonio Coca (Испания), Gert J. De Borst^{†††} (Нидерланды), Victoria Delgado (Нидерланды), Florian Dick^{††} (Швейцария), Cetin Erol (Турция), Marc Ferrini (Франция), Stavros Kakkes^{††} (Греция/Великобритания), Hugo A. Katus (Германия), Juhani Knuutila (Финляндия), Jes Lindhoff^{††} (Дания), Heinrich Mattle^{††} (Швейцария), Piotr Pieńiążek (Польша), Massimo Francesco Pierpoli (Италия), Dierk Scheinert (Германия), Horst Sievert (Германия), Ian Simpson (Великобритания), Jakub Sulzenko (Чехия), Juan Tamargo (Испания), Lale Tokgozoglu (Турция), Adam Torbicki (Польша), Nikolaos Tsakountakis (Греция), José Luis Zamorano (Испания), Melina Vega de Ceniga^{††} (Испания), Stephan Windecker (Швейцария), Jose Luis Zamorano (Испания).

Декларации конфликта интересов всех экспертов, участвовавших в разработке настоящих рекомендаций, доступны на сайте ESC <http://www.escardio.org/guidelines>.

Приложения, вопросы и ответы, относящиеся к данным методическим рекомендациям доступны на странице: www.escardio.org/Guidelines/Clinical-Practice-Guidelines/Peripheral-Artery-Diseases-Diagnosis-and-Treatment-of.

Carotid artery disease

Evs guidelines carotid endarterectomy.

Although I do not personally agree with its recommendations, for example, in the management of concurrent cardiac surgery and carotid stenosis, or nuances of decision-making in asymptomatic patients, it is extremely informative and impressive to see most of the evidence that the authors of the guidelines present. doi: * 2017 from the Society for Vascular Surgery. Many recommendations are similar to those presented in the American Heart Association / American Heart Association / American Thoracic Society (AHA / ASA) guidelines, 2 but the ESV 2017 guidelines include several new features, such as sections on trials supporting rapid interventions in newly symptomatic patients, timing of interventions after thrombolysis and management of carotid and concurrent heart disease Right. In spirit, I was surprised to find little consideration of it in the 2017 ESV document. 67Issue 2PreviewThe 2017 European Society for Vascular Surgery (ESV) Guidelines for the management of atherosclerotic carotid and vertebral artery disease is a comprehensive document that should guide clinical practice not only in Europe but also worldwide. Considering that this may be related to the temporal availability (or lack thereof) of recent studies and trials, the hybrid, direct transcarotid pathway approach with reverse flow as a protective mechanism must be demonstrated as the lowest risk of peripheral arterial disease by any carotid stent. Considering that many if not most of these criteria are both intuitively logical based on what we know of tract pathogenesis from carotid lesions and evidence based on observational, conglomerate studies, many of the imaging criteria listed are not generally available in most practices. *itthabid_itthabid_hicceV* AEC led acrifireper aceruzis al erguiguer ethelemaizneot e otaeilgim ahs elhc elhabor. A oeditord id tneis of elhc atarialcid osseps avresir al enetoc irotua ilged ovisulcnoc ofargrap II . fallacy of revisionist history, and transatlantic differences in clinical decision-making referable to carotid bifurcation atherosclerosis are highlighted in the newly published 2017 European Society for Vascular Surgery (ESV) guidelines. 1Naylor A.R., Ricco J.B., de Borst G.J., Debus S. The 2017 ESV guideline appears to be concordant with this information in that its recommendation 19 considers CAS only in selected (as noted before) asymptomatic patients when *cAAthe multidisciplinary team* determines the patient to be at high risk for surgery. *cAA* The fact that long-term data from CREST and ACT I suggest long-term protection from stroke is equivalent for both CEA and ACAS indicates that the practical consideration of getting such stents in safely should be predominant in clinical decision-making. The imaging characteristics claimed to subgroup asymptomatic patients with a >60% stenosis as high risk for stroke are largely duplex ultrasound derived (lesion progression and plaque characterization) but also include the identification of prior ipsilateral stroke on brain imaging and the identification of dynamic plaque events such as intraplaque hemorrhage on magnetic resonance imaging (MRI). Even somewhat amusing is the resurrection of the carotid artery stenting (CAS) as an alternative (typically considered in some quarters to mean equivalent) to carotid endarterectomy (CEA) language; at least in symptomatic patients, the 2017 ESV guideline strongly endorses CEA (vs CAS) as the preferred intervention in the majority of patients. et al. Writing GroupManagement of atherosclerotic carotid and vertebral artery disease: 2017 clinical practice guidelines of the European Society for Vascular Surgery (ESV) [published online ahead of print].Abstract Full Text Full Text PDF PubMed Scopus (504) Google Scholar The document itself is ponderous, running some 80 pages and inclusive of nearly 500 references; indeed, I found it a reference document. This has been verified in many meta-analyses in addition to well-led randomized prospective studies, such as carotid cooterection endarterectomy vs stenting trial (CREST) and Asymptomatic Carotid Trial (ACT) I. The Society for Vascular Surgery Vascular Quality Initiative has collaborated with The Food and Drug Administration and with Centers for Medicare and Medicaid Services to evaluate the safety and effectiveness of this carotid stenting approach. The ESV 2017 guideline should serve as a reference guide for vascular surgeons in the clinical decision making. It is known, for example, that a third of carotid bifurcation lesions detected with magnetic resonance will demonstrate to have intraplaque bleeding, regardless of the symptomatic state of the patient. This, of course, suggests that the surrogate that has always been used to identify the plaque at risk in an asymptomatic patient, the degree of stenosis, is perhaps completely logical after all. Furthermore, suggesting that all asymptomatic patients should undergo a high resolution magnetic resonance for the characterization of the plaques would be imprudent from the point of view of the cost-effectiveness ratio. De Harry J. Unlike almost all existing guidelines, the new document does not take into consideration the degree of stenosis or fundamental clinical features, such as the patient's age. Posted by Elsevier Inc. This is, in turn, aligned with the recommendations to proceed with CEA within 2 weeks from the neurological index event and the related and convincing information that Transphemoral CAS in this context has rates of unacceptable neurological complications. Wheel of the previous guidelines in its consideration of asymptomatic patients, the ESVS 2017 document attempts to define subgroups of patients (only on the basis IMA that could be at greater risk of stroke and therefore benefit from an intervention that goes beyond medical therapy). Maybe it's the case. The first clinical trial of this strategy was reported in Western Europe, since then, this hybrid approach to carotid stenting with reverse flow has rapidly become popular among North American vascular surgeons. However, the decision-making algorithm for asymptomatic patients lists a life expectancy > 5 years as a qualifying criterion; few would disagree with this. ScienceDirect Seeing Lights and Shadows: A Commentary on the European Society of Vascular Surgery Carotid Endarterectomy Guidelines 2017Journal of Vascular SurgeryVol. Also, whether you consider the demonstration of intraplaque hemorrhage in a magnetic resonance study or continuous ultrasound embolization from an ecocolor plaque, it has been shown that these plaque characteristics increase linearly with the degree of stenosis. Full-Text PDF Open Archive Finally, although it is fashionable to suggest that the degree of stenosis is not related to the prediction of stroke in asymptomatic patients, there is both the North American Symptomatic Carotid Endarterectomy Trial (NASCET) and contemporary literature that show that the greatest risk occurs in patients with truly preocclusive lesions. Traditional distal transfemoral protection CAS is accompanied by a double periprocedural risk of stroke/death compared to CEA. The special communication article by Paraskevas et al., published in this issue of the Journal of Vascular Surgery, is a useful for discerning differences in current ESVS guidelines that could be per esempio, con le linee guida ampiamente citate American Heart Association and Society for Vascular Surgery. linee guida.*
